CODEWRITING

SCORE: 300/300

Correct variable names consist only of English letters, digits and underscores and they can't start with a digit.

Check if the given string is a correct variable name.

Example

- For `name = "var_1__Int"` , the output should be
`variableName(name) = true ;`
- For `name = "qq-q"` , the output should be
`variableName(name) = false ;`
- For `name = "2w2"` , the output should be
`variableName(name) = false .`

Input/Output

- **[execution time limit] 4 seconds (js)**
- **[input] string name**

Guaranteed constraints:

$1 \leq \text{name.length} \leq 10$.

- **[output] boolean**

`true` if `name` is a correct variable name, `false` otherwise.

[JavaScript (ES6)] Syntax Tips

```
// Prints help message to the console
// Returns a string
function helloWorld(name) {
    console.log("This prints to the console when you Run Tests");
    return "Hello, " + name;
}
```
