BACK   Find Email Domain   ⊽ 187,404   ⌄

DESCRIPTION   SOLUTIONS 3819   COMMENTS 2   README ❯   CODEWRITING   SCORE: 300/300

An email address such as `"John.Smith@example.com"` is made up of a local part (`"John.Smith"`), an `"@"` symbol, then a domain part (`"example.com"`).

The domain name part of an email address may only consist of letters, digits, hyphens and dots. The local part, however, also allows a lot of different special characters. Here you can look at several examples of correct and incorrect email addresses.

Given a valid email address, find its domain part.

Example

- For `address = "prettyandsimple@example.com"` , the output should be
  `findEmailDomain(address) = "example.com"` ;
- For `address = "<>[]:,;@\"!#$%&*+-/=?^_{}| ~.a\"@example.org"` , the output should be
  `findEmailDomain(address) = "example.org"` .

Input/Output

- **[execution time limit] 4 seconds (js)**

- **[input] string address**

  Guaranteed constraints:
  `10 ≤ address.length ≤ 50` .

- **[output] string**

[JavaScript (ES6)] Syntax Tips

```
// Prints help message to the console
// Returns a string
function helloWorld(name) {
    console.log("This prints to the console when you Run Tests");
    return "Hello, " + name;
}
```
